                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length Polymorphism analysis (PRA) method. The method comprises obtaining a restriction fragment length polymorphism analysis (PRA) amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RELP patterns from the Microorganism to be identified and comparing the RELP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae and on tuberculosis mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HIV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical ests. Also described are oligonicleotide probes (AASO5227-AASO5242) for
                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Non-tuberculous mycobacteria; rpoB gene fragment; NTM; HIV; PRA; RFLP; PCR-restriction fragment length polymorphism analysis; ds.

The present sequence for Mycobacterium abscessus rpoB gene fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (RRA) method comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragmen from the Microorganism to be identified and comparing the RFLP patterns from the Microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments with the unidentified and pathogenesis information for are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. laprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HIV). Analysis of the rpoB gene fragments is rapid, precises, simple and cost effective (only 1 pCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual blochemical defertion sensition workharerial sensited.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           HIV; PRA; RFLP;

The present sequence for Mycobacterium fortuitum rpoB gene fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragments (PRA) capping and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments from the comparing the RFLP patterns from the known rpoB gene are useful to identify a wide range of Mycobacterium species. e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate theraphes, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (HTW) encountered in subjects infected with human immunodeficiency virus (HTW) analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 pcR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual blochemical according a process. Also described are oligonucleotide probes (AAS05227-AAS05242) for a fragment in a process in a single accounter of a process in a single and can be also a process in a single and can be also an additional and can be processed and a processed and 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        GTCTTGGCGGTGCCAACCCGGCTCTGGTGACTGCCACCACGCTCACCGAGGAAGACGTCG 120

fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from
fragment is 1 of 24 rpoB gene fragments can be used
various Mycobacterial species. These rpoB gene fragments can be used
in the diagnosis and identification of Mycobacterium species using a
novel PCR-restriction fragment length polymorphism analysis (PRA)
method. The method comprises obtaining a restriction fragment length
cc polymorphism (RFLP) pattern of the 24 rpoB gene fragments: isolating,
amplifying and digesting the DNA fragment fragments: isolating,
cc polymorphism (RFLP) pattern of the 24 rpoB gene fragments isolating,
cc pelmittied and comparing the RFLP patterns from the microorganism to
be identified and comparing the RFLP patterns from the shown rpoB gene
cc ragments with the unidentified fragment. The rpoB gene fragments
cc are useful to identify a wide range of Mycobacterium species, e.g. for
diagnosis or to obtain epidemiological and pathogenesis information for
cc selection of appropriate theraples, including M. tuberculosis, M. leprae
and non-tuberculous mycobacteria (NTW) encountered in subjects infected
with human immunodeficiency virus (HTW). Analysis of the rpoB gene
cc fragments is rapid precise, simple and cost effective (only 1 PCR
required), and can differentiate between many species in a single
cxperiment, including those difficiult to distinguish by usual blochemical
cests. Also described are oligonucleotide probes (AASO5227-AASO5242) for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 GTCTTGGCGGTGCCAACCCGGCTCTGGTGACTGCCACGACGCTCACCGAGGAAGACGTCG 120

The present sequence for Mycobacterium avium rpoB gene fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragments (RFLP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments of angential to identified fragment. The rpoB gene fragments are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (MrW) encountered in subjects infected with human immunodeficiency virus (HIV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 pcR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual blochemical defenction of described are oligonucleotide probes (AAS05227-AAS05242) for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ij

The present sequence for Mycobacterium flavescens rpoB gene fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel pCR-restriction fragment length polymorphism analysis (PRA) polymorphism (RFLE) pattern of the 24 rpoB gene fragment isolating, polymorphism (RFLE) pattern of the 24 rpoB gene fragment isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments are useful to identify a wide range of Mycobacterium species, e.g. for fragments with the unidentified and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected inth human immunodeficiency virus (HTV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual blochemical effecting specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ï

New DNA fragments from the rpoB gene of mycobacteria, useful for diagnosis and identification of many mycobacterial species by restriction fragment length polymorphism

Claim 1; Page 40; 50pp; English.

The present sequence for Mycobacterium gordonae type I rpoB gene fragment is 1 of 24 rpoB gene fragments (AAS02201-AAS0224) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) comprises obtaining a restriction fragment length polymorphism (RFuP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFuP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments of fagnesis or to obtain epidemiological and pathogenesis information for a selection of appropriate therapies, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (MTM) encountered in subjects infected with human immunodeficiency virus (HTW) analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical certerium sensitive manific moniting manification. detecting specific Mycobacterial species.

Claim 1; Page 43; 50pp; English.

The present sequence for Mycobacterium marinum rpoB gene fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from values Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) (method. The method comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to comparing the DNA fragment from the Microorganism to it fragments with the unidentified fragment. The rpoB gene fragments of the 10 dentified and comparing the RFLP patterns from the Known rpoB gene fragments of diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected (mith human immunodeficiency virus (HTW). Analysis of the rpoB gene caquired), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual blochemical casts. Also described are oligonucleotide probes (AAS05227-AAS05242) for equired).

The present sequence for Mycobacterium ulcerans rpoB gene fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from various Mycobacterial species rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) method comprises obtaining a restriction fragment length polymorphism (RELP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments is colection of appropriate therapies, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (MTM) encountered in subjects infected with human immunodeficiency virus (HTV). Analysis of the rpoB gene fragments is rapid, precises, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical referentian analysis of the roors.
                                                                                                                                                                                                                                                                                                                                                                                                                                Non-tuberculous mycobacteria; rpoB gene fragment; NTM; HIV; PRA; RFLP; PCR-restriction fragment length polymorphism analysis; ds.

detecting specific Mycobacterial species.

```
The present sequence for Mycobacterium gordonae type II rpoB gene fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5214) from varIvobs Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) method comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments of fragments is considered and patterns from the known rpoB gene fragments of the contain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tubbacculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HIV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 PCR

required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical tests. Also described are oligonucleotide probes (AAS05227-AAS05242) for detecting specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence for Mycobacterium celatum rpoB gene fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) method. The method comprises obtaining a restriction fragment length polymorphism (RPLP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RPLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments

ä
are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HIV). Analysis of the rpoB gene fragments is raphd, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual blochemical facts. Also described are oligonuclectide probes (AASO5227-AASO5242) for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Non-tuberculous mycobacteria; rpoB gene fragment; NTM; H1V; PRA; RFLP; PCR-restriction fragment length polymorphism analysis; ds.

novel PCR-restriction fragment length polymorphism analysis (PRA)

method. The method comprises obtaining a restriction fragment length

polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating,

amplifying and digesting the DNA fragment from the microorganism to

creaments with the unidentified fragment. The rpoB gene fragment ship are useful to identify a wide range of Mycobacterium species, e.g. for

diagnosis or to obtain epidemiological and pathogenesis information for

selection of appropriate therapies, including M. tuberculosis, M. leprae

and non-tuberculous mycobacteria (MTM) encountered in subjects infected

with human immunodeficiency virus (HTW). Analysis of the rpoB gene

required), and can differentiate between many species in a single

experiment, including those difficult to distinguish by usual biochemical

cestering and described are oligonucleotide probes (AASO5227-AASO5242) for
                                                                                                                                                                                                                                                                                                                                              ï

fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from
various Mycobacterial species. These rpoB gene fragments can be used
in the diagnosis and identification of Mycobacterium species using a
novel PCR-restriction fragment length polymorphism analysis (PRA)
method. The method comprises obtaining a restriction fragment length
covel PCR-restriction fragment length polymorphism analysis (PRA)
method. The method comprises obtaining a restriction fragment length
covel PCR-restriction of the 24 rpoB gene fragments: isolating,
amplifying and digesting the DNA fragment from the microorganism to
be identified and comparing the RELP patterns from the known rpoB gene
fragments with the unidentified fragment. The rpoB gene fragments
created to identify a wide range of Mycobacterium species, e.g. for
diagnosis or to obtain epidemiological and pathogenesis information for
selection of appropriate therapies, including M. tuberculosis, M. leprae
and non-tuberculous mycobacteria (NTW), analysis of the rpoB gene
crequired), and can differentiate between many species in a single
experiment, including those difficult to distinguish by usual biochemical
tests. Also described are oligonuclectide probes (AAS05227-AAS05242) for
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ξ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               q
                                                                                                                     The present sequence for Mycobacterium xenopi rpoB gene fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO521) from various Mycobacterial species. These rpoB gene fragments can be used to the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism malysis (PRA) comprises obtaining a restriction fragment length colymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments of the indentified fragment in the prob gene fragments of contains to indentified fragments from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments of of apropriate therapies, including N. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected fragments is rapid, precise, simple and cost effective (only 1 PCR cequired), and can differentiate between many species in a single tests. Also described are oligonucleotide probes (AASO5227-AASO5242) for Adaptive and including those difficult to distinguish by usual biochemical contains and including those difficult and probes (AASO5227-AASO5242) for Adaptive and and are oligonucleotide probes (AASO5227-AASO5242) for

The present sequence for Mycobacterium tuberculosis rpoB gene fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO524) from cardinal waycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) cemethod comprises obtaining a restriction fragment length polymorphism analysis (PRA) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragment with the unidentified fragment. The rpoB gene fragments with the unidentified fragment. The rpoB gene fragments of comparing the RFLP patterns from the known rpoB gene cragments with the unidentified fragment. The rpoB gene fragments of agnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including the unidentified fragment is constituted in subjects infected and non-tuberculous mycobacteria (RTMM) encountered in subjects infected fragments is rapid, precise, simple and cost effective (only 1 pCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual blochemical creater in analysis of the rose of experiment in condition are obtained are oil general problems (RESS-277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO52277-AASO522
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 GTCTTGGCGGTGCCAACCCGGCTCTGGTGACTGCCACCACGCTCACCGAGGAAGACGTCG 120

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

          Mycobacterium tuberculosis CDC1551.

Mycobacterium tuberculosis CDC1551.

Mycobacterium tuberculosis CDC1551.

Actinomycetales: Actinobacteriae.

Actinomycetales: Corynebacterineae; Mycobacteriaceae;

Mycobacterium; Mycobacterium tuberculosis complex.

[ pases 1 to 19352]

```
Details of M. tuberculosis sequencing at the Sanger Centre are available on the World Wide Web.

(URL, http://www.sanger.ac.uk/Projects/M_tuberculosis/) CDS have been renumbered from the original cosmid submissions but the old gene designations are in brackets after the new gene numbers. Gene prediction was based on a Hidden Markov Model of TB genes implemented in TBparse (Krogh) supplemented with visual inspection of positional base preference in codons, especially where there is an increase in the observed/expected third position q + c.

CAUTION: In some cases we may not have predicted the correct intitation codon. Where possible we choose an initiation codon (atg, qt, or ttg) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream
                                                                                                                                                                                                                           Bacteria; Firmicutes; Actionbacteria; Actinobacteridae;
Actionbycetales; Corynebacterineae; Mycobacteriaceae;
Mycobacterium; Mycobacterium tuberculosis complex.

                                                                                                                                                                                        // ACCE—"Vector: Landar State Merricoll were disrupted using a Mini bead beater (Biospec). RNA was isolated using the RNeasy protocol (Qiagen). Purified RNA was subjected to 2 rounds of digestion with RNase-free DNase I (Promega). DNase I was heat-inactivated at 75cC for 5 min. and removed by using RNeasy columns followed by phenol extraction and ethanol precipitation. The RNA preparations were confirmed to be free of genomic DNA contamination by carrying out PCR and RT-PCR using the Access kit (Promega) and primars specific for the histone-like protein gene hip (Lee et al., 1998). cDNA was synthesized using random hexamer primers (Promega) and Stratagene's cDNA synthesis kit. CDNA fragments were ligated into lambda 2AP II vector and packaged in vitro using Stratagene reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Eukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta; Spermatophyta; Magnoliophyta; Eiliopsida; Poales; Poaceae; Pooldeae; Triticae;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /note="Vector: pBluescript SK+; Site_1: EcoRI (5'-end of CDNA); Site_2: XhoI (3'-end of CDNA); Due to a cloning artefact caused by the kit, in most cases the EcoRI site is NOT present, as well as the EcoRIadapter used for cloning. To excise the insert, restriction sites upstream EcoRI should be used (e.g. bamHI, Sali, PStI). NOTE: Also due to the cloning system used Blue/white selection for recombinats is not 100% reliable.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /organism="Hordeum vulgare"

C.I. 16151 (Mla6) plants were greenhouse grown in the R
Wise lab at Iowa State University, Ames, IA; 7 day old
green seedlings were challenged with isolate 5874 (AvrMla6)
) of Blumeria graminis f. sp. hordel, and leaves were
harvested 20 and 24 hr post-incoulation and snap frozen;
uninoculated leaves were harvested 20 hr post-incoulation
(Wel, Wise). In the TJ Close lab at the University of
California, Riverside, total RNA was prepared from each
sample pool, equal quantities of all three RNA pools were
combined, poly(A) RNA was purified from the mixture, one
primary unamplified cDNA library was made, and 1 million
pfu were in vivo excised to give pBluescript SK(-) cDNA
phagemids (Choi, Close). Phagemids were plated and picked
at the Clemson University Genomics Institute (CUGI) (Begum
, Palmer, Frisch, Atkins and Wing). Plasmid DNA
preparations, DNA sequencing and sequence analysis were
performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates
, Rambo, Maln). The sequence has been trimmed to remove
vector sequence and contains a minimum of 100 bases of
phred value 20 or above. For more details on library
preparation and sequence analysis see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     EST 19-SEP-2001

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /noce="Vector: plasmid pBK-CMV; Site_1: EcoRI; Site_2:
XhoI; mRNA was made from developing caryopsis (3.-15.DAP)
of spring bariely variety 'Barke', a high quality malting
variety. Cloning sites: EcoRI (5'-end of cDNA) and XhoI
(3'-end of cDNA). NOTE: Due to a cloning artefact caused
by the kit, in most cases the EcoRI site is NOT present,
as well as the EcoRI adapter. Average insert size is ikb
Sequence trimming: Vector sequences and sequence ends were
trimmed from the 5'-and 3'-end until a 50 bp window
contains less than two ambiguities. The maximum length was
set to 700 bp=
set to 702 gp 98 t 8 others
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ανοδ///1
